LUNDAHL
— TRANSFORMERS —

**Important
Read this!**

With LUNDAHL, all PLATE chokes can be used as POWER SUPPLY chokes and vice versa. Though Power Supply chokes are specified @ ~RMS, and subject to ~100Hz or ~120Hz ripple, they are made with audiophile cores, and full audio range always.

Chokes with high inductance have many windings, and so higher DC resistance. This protects the rectifiers and capacitors. Though you do have some voltage loss across the DC resistance, this resistance limits the current, when the choke is saturated at cold start, due to empty capacitors. In case you do not want the power loss, lower resistance types exist too. For convenient selection, we have put them all here in one table, first sorted by DC Current, then by Henry.

CHOKES for Anode or Power Supply.

Note, there is little logic in the product numbers. Select from this table first your DC current, then choose the Henry. Mind the DC resistance. Check the Lundahl section, "Plate Chokes" about how and why is it allowed to exceed the rated DC current.
